

# Asset Management for Mobile Mapping

Orbit GeoSpatial Technologies has released Orbit Asset Inventory Management for Mobile Mapping. This tool facilitates access and deliver mobile mapping data and includes extract features, overlay content, document objects and more.

"This new release might well be the first multi-user production environment based on a variety of mobile mapping systems and directly integrated in GIS", says Peter Bonne, VP Business Development and senior product manager at Orbit GT. By abstracting the Mobile Mapping production systems and managing all content centrally, users can view, overlay, extract, share and integrate on the desktop, internet and mobile devices.
