

# GeoDyn Launches Aerial Film Conversion Services

During the ISPRS Conference in Prague, Czech Republic, GeoDyn Technology announced the introduction of its service for aerial film conversion. Based on novel technology, the system converts aerial photography at a rate of 10 frames per minute with a resolution of 20 microns.

In addition to the digital images, accurate georeferenced image maps are produced in an automated workflow for overlay on existing maps or satellite imagery and integrated into a range of applications for efficient visualisation and analysis. All work is carried out at the client's premises. Aerial photography archives of 1 million frames can be converted in less than 1 year.
