

New Version of Correlator3D Introduced

Developer of photogrammetry software SimActive has launched [Correlator3D](#) version 6.3 with an expanded UAV enterprise offering. A new floating licensing option allows computers on the same network to seamlessly borrow licences from a pool, increasing transferability for enterprise requirements.

Due to the worldwide client base of [Correlator3D](#), multi-language support is also introduced with this version. Users can now operate the software in multiple languages, along with the default English option. Examples of the increased selection include Chinese, Japanese and French.

With users in over 50 countries, including many with enterprise requirements, the company continues adding features to meet the immense industry demand for the product, said Louis Simard, CTO of SimActive. According to Simard, Correlator3D has a processing speed at least ten times faster than entry-level UAV software.

For a live demonstration at the Capturing Reality Forum (23-25 November, Salzburg, Austria), SimActive welcomes you to visit booth 37.
