

Topcon Introduces New Motorised Total Station

Topcon Positioning Systems (CA, USA) has announced the GPT-8203M, a new addition to Topcon's 8200 series of long-range reflectorless total stations. This precision instrument is specially designed to expedite layout of formwork, structural components, anchor bolts, as well as all other construction elements that require accurate positioning. Onboard software and a servo-drive work together to automate point stakeout.

All GPT-8200 models feature EDM, enabling reflectorless measurements up to 1,200 metres. With a standard prism, the measurement range is extended to 7,000 metres – almost 23,000 feet.
