

# 3D-GIS Cloud App for iPad and Smartphones

Sivan Design has released its 3D-GIS in the Cloud App for Apple iPad. The App is available for free download from the App Store. The app allows its users to navigate the city and its underground in 3D, retrieve spatial information about buildings and infrastructures and perform three dimensional GIS analysis.

The App extends the organisation's GIS reach beyond the office and allows its employees to make collaborative and accurate business decisions in both field and office environments. The App is a tool for organisations that wish to keep their GIS information current with ease and supply their on-site personnel with the most current information to

perform their tasks more efficiently while reducing possible disorientation-information errors.

The 3D-GIS in the Cloud App offers all the 3D views and 3D analysis features available in the 3D-GIS in the Cloud application. The App relieves the device from handling any 3D rendering and data calculations which are all performed in the cloud. The cloud can be either public or private and serves the entire 3D-GIS in the Cloud applications scope.

Versions for Android and other Smartphone devices are expected to be released shortly.
