

3D Mapping Portal

Agency9 (Sweden) has entered into a partnership with the aerial survey company Slagboom en Peeters in The Netherlands, to deliver a geoportal for which users can view its data products, currently “Geo-Oblique” and Orthophoto in one seamless integrated view. Unlike other portals in the market the user can conveniently see an object from all possible angles and use the data view that is best for the application. Additional data types will be introduced later this year.

Adding Oblique Viewer extends the value of the 3DMaps platform as the leading solution for visualisation of 3D geospatial data. The combination of different data types such as oblique, ortho, terrain, street view and 3D in an integrated view allows the user to select the best data view for the application of their choice.
