

Aerodata Completes Data Acquisition in The Netherlands

Aerodata Int. Surveys (Belgium) has announced the completion of aerial photography of the province of Zeeland (The Netherlands) with her own digital frame camera, the 90-megapixel Vexcel UltraCam-D, at 15cm GSD (Ground Sample Distance). In three days of perfect weather conditions more than 5.000 photos with stereoscopic overlap were taken over an area of around 3.000km², after which the data acquisition of built-up areas with 7,5cm GSD commenced. Only a few days later all 15cm imagery had passed quality assurance to enable further digital processing (orthorectification and mosaicking) without any delays. The complete dataset will be ready and will be commercially available for everyone from the end of July 2005.
