

Applanix Image View v3.0

Applanix (Canada) has released version 3.0 of its Image View software specifically designed for use with its DSS Digital Sensor System to generate georeferenced colour and Colour InfraRed (CIR) digital imagery. The software produces full-resolution or sub-sampled data sets from raw digital camera data for direct input into standard mapping software. The new release includes a number of system-specific enhancements that include an automatic correction for radiometric lens falloff and a calibration tool to compensate for image-to-image intensity differences. These features improve the image quality of ortho-rectified mosaics. The new version is available to DSS Digital Sensor System customers free of charge via Applanix's sales representatives.
