

Belgian Road Research Centre Chooses Mobile Mapping System

The Belgian Road Research Centre (BRRC) has recently chosen imajbox, a mobile mapping system from imajing, to perform road network condition assessment and monitoring and keep memory of field status. imajbox can be installed on various vehicles in order to record field data which will be valuable for results interpretation and validation.

The Belgian Road Research Centre (BRRC) is a research institute which has built a solid reputation over fifty years of existence. Its research is focused on the areas of road design, construction, maintenance, safety and mobility. Over the years, the BRRC has been developing an extensive package of services and tools to assist and advise road network players.

In addition to the archiving objectives, the BRRC and DrivenBy – specialised in geodata acquisition – have jointly validated a visual inspection method based on imajbox surveys.

For product information on the imajbox and other mobile mapping systems, see Geo-matching.com.
