

Blaze Terra Supports Multi-band Imagery

Blaze Terra of Eternix, Israel, supports visualisation and processing of multi-band imagery. This new capability allows real-time presentation and manipulation of thousands of colour bands in high dynamic range (both 8 and 16 bits per channel).

Colour bands can further be blended and tuned by the end user to enhance the way various objects appear in an image. The high performance of Blaze Terra is preserved when working with multi-band images of virtually unlimited size.

This new feature is seamlessly integrated with all existing Blaze Terra capabilities, such as on-the-fly reprojection, draping of imagery on top of elevation model and stereo visualisation.
