

CHC Wins GNSS Receivers Contract in Turkey

CHC Navigation, China, has been awarded a contract to supply 50 units of X91+ GNSS receivers with LandStar field data collection software to the Turkish General Directorate of Land Registry and Cadaster (TKGM). The X91+ GNSS receivers will be used to support the TKGM's core activities, such as land registration, cadastral surveys, services of geodetic infrastructure and map productions and creating a spatial information system infrastructure.

CHC Navigation and its Turkish distributor, GNSS Teknik, have demonstrated the performance of the X91+, pushed forward local support capabilities and provided full compliance with the tender requirements against leading GNSS manufacturers.

The award of this significant tender from a renowned governmental entity is a real achievement for CHC's international development, in particular since CHC is the first Chinese GNSS company to be selected by the Turkish Cadaster, according to George Zhao, CEO of CHC.
