

Core Production Database Version 2.5 Now Available

Caris (Canada) has released Core Production Database (CPD) version 2.5. Using Oracle data processing, CPD is a seamless, geospatial database that enables stakeholders to consolidate their data into a single source, thus removing redundancy and establishing more efficient use of available data.

Version 2.5 delivers new support for Unicode character sets, support for all regional language settings, a new graphical user interface program for loading files to the database, and enhancements to the project management functionality providing more direct linkages of projects to data production.

CDP is designed to be a truly open enterprise solution. The data model is customisable for scalability within an enterprise environment. Furthermore, source data in CPD can be published using web-mapping applications while linking this published data to supporting databases provides additional attribution to spatial data.
