

# Encom Discover 7.0, Integrated GIS for the Geosciences

Encom Technology Pty Ltd (Australia) has released Encom Discover 7.0, which replaces Discover 6.11 as a geoscience application for MapInfo Professional GIS.

Discover 7.0 includes two new modules. The new Geochemistry module provides statistical analysis, visualisation and manipulation tools for working with geochemical data.

A new Images module provides a number of useful image editing and manipulation tools including the ability to perform image rectification (rubber sheeting) and enhancement.

Discover 7.0 also includes extensive enhancements and additions to the existing range of data, object and map manipulation functions.

Encom Discover is the desktop GIS designed especially for the geosciences, providing the tools to effectively compile, visualise, analyse and map spatial geoscience data.

Encom Discover offers a range of advanced tools to streamline geological mapping. Scaled output and in-built geological colour, linework and symbol libraries makes it easy to create high-quality geological maps quickly and accurately.

Encom Discover lets you create and instantly visualise gridded data, drillhole data and numerical attribute data, while advanced table and data editing utilities let you search, sort and manage datasets interactively.
