

Envista Launches Solution for Infrastructure Project Coordination

Envista Corporation (MA, USA) has unveiled its web-based solution for infrastructure project coordination among multiple infrastructure stakeholders. Envista's technology introduces map-driven, real-time sharing of construction and maintenance project schedules among municipalities, utilities, and highway agencies. Envista's 'Software as a Service' allows project leaders to view projects on a map, and see what work is planned in a specific geographic location during a particular time period.

This new capability enables stakeholders to instantly troubleshoot potential conflicts. Envista pioneers a wide range of features including automatic geo-location of projects on a map, instant identification of conflicts, integrated communication among project owners, management dashboard views, and more. Using the Internet and a standard browser, annual subscribers have a convenient, centralized way to exchange planning schedules with all stakeholders.
