

# EuroSDR Questionnaire on Oblique Airborne Photogrammetry

EuroSDR has an ongoing activity in oblique aerial camera systems, a rediscovered technology in the photogrammetric and mapping field. Oblique aerial systems are rapidly maturing and expanding the market with many R&D open issues. For these reasons a questionnaire has been prepared to highlight the potential of oblique camera systems for mapping and modelling purposes and to collect technical details and information on hardware and software.

All hardware and software producers, users and agencies working with oblique airborne images are invited to participate in this questionnaire. The questionnaire will only take 5 min of your time and your cooperation would be really appreciated. The questionnaire can be found [here](#).

## About EuroSDR

EuroSDR is a not-for-profit organisation linking National Mapping and Cadastral Agencies with Research Institutes and Universities in Europe for the purpose of applied research in spatial data provision, management and delivery
