

# Extensis and LizardTech Continue as One Company

Extensis and LizardTech have announced they are uniting as one global company to help organisations increase the ROI and value of their digital assets, fonts, and large imagery. Last year, Extensis and LizardTech collaborated on the development of new portfolio asset geo-referencing capabilities that make it ideal for applications in the geospatial, infrastructure, AEC and BIM segments.

With Extensis' market leadership in digital asset and font management combined with LizardTech's expertise in image management and state-of-the-art image compression technology, the united company expects to be in an excellent position to provide a suite of solutions and support for digital asset challenges that no other company can match.

## Maximising the value of digital assets

Organisations today are investing in imagery of all kinds, including photography, aerial, and spatial, to name a few, stated Osamu Ikeda, CEO of Extensis. Fully leveraging these digital files means having an easy and efficient way to organise, store, access, and distribute them. Ikeda continued that uniting Extensis and LizardTech strengthens the ability to support customers' success and give them effective and time-tested solutions for maximising the value of digital assets of all kinds.

The combined company will operate under the Extensis brand, headquartered in Portland, Oregon with an office presence in Seattle, Washington.

Starting today, LizardTech products (GeoExpress, Express Server, GeoViewer) will become part of the Extensis suite of solutions, which spans digital asset management, font asset management, brand asset management, image management, and image compression.
