

Free Internet Seminar from ESRI

Administrators can learn how to better manage ArcGIS Server by tuning in to an upcoming Web seminar that provides an overview of the product's architecture along with related data access and security information.

ArcGIS Server Setup and Administration will air on ESRI's Training and Education Web site at www.esri.com/lts on 28th February 2008, at 9:00 a.m., 11:00 a.m., and 3:00 p.m. (Pacific standard time).

People unfamiliar with ArcGIS Server will benefit from first watching the free training seminar, *What's New in ArcGIS Server at 9.2*, at www.esri.com/server92seminar.

ArcGIS Server provides many ways to build and deploy a true server-based geographic information system (GIS). But whether your organization uses the product out of the box or in a customized environment, learning some basics about the software's architecture will help in managing the technology. During the seminar, attendees will learn about

- The overall product architecture including the different components of ArcGIS Server and where they can be installed
- How the architecture relates to data access and security and how to manage users and permissions
- Configuring service properties using ArcGIS Server management tools
- How to locate ArcGIS Server documentation and help resources

A broadband Internet connection and an ESRI Global Account are needed to watch the seminar. Creating a global account is easy and free: visit www.esri.com/lts, click Login, and register your name and address. After the live presentation, the seminar will be archived and available on the ESRI Training and Education Web site.

For more information about this free live training seminar and upcoming classes, visit <http://training.esri.com/gateway/index.cfm>.
