

# Geneq GPS Mapping Receiver

Geneq, Inc. (Canada) has introduced the SXBlue II, a submeter Bluetooth wireless GPS mapping receiver that allows you to use off-the-shelf Bluetooth-enabled PDA/notebook computers to collect GPS map data.

As the second generation in Geneq's SX Blue line, the SX Blue II offers improved tracking/accuracy under tree canopy, improved accuracy in open sky conditions, integrated battery pack, battery pack "gas gauge", 200 metre long-range Bluetooth, USB port and improved form factor.

There is no need for post-processing or other sources of differential corrections as the SX Blue II uses WAAS (North America), EGNOS (Europe), MSAS (Japan) or GAGAN (India) satellite corrections. The users get real-time, submeter positioning all day long.

The SXBlue II is targeted at GPS/GIS mapping professionals in industries such as forestry, utility, agriculture and other natural resource industries in addition to municipal, state and federal government users.

The SXBlue II has a list price of US\$1,995.00.
