

Geneq Releases New Rugged Tablet for Field Professionals

Geneq has announced the SXtab RTK, the latest tablet model in the SXtab series. The rugged tablet is aimed at improving the mobility of professional field workers, and designed with a view to reducing the equipment used to achieve high accuracy during data collection.

The SXtab RTK can receive RTK corrections, which let the user achieve great accuracy using either the Antenna that comes with the tablet or an external antenna. This tablet runs on an Android OS, offering a wide variety of compatible data collection applications and allowing a perfect all-in-one solution.

The SXtab features an 8-inch and sunlight-readable display. With the IP65 certification, it will endure the harshest outdoor conditions. The tablet's capability to receive RTK corrections is powered by a varied connectivity system of Bluetooth, Wi-Fi and 2G, 3G and 4G cellular networks.

The new tablet is easy to carry around with the fixed hand strap behind the unit. The pole adaptor option is also available for on-the-ground point survey. Moreover, an external antenna can be put on top of the pole and plugged into the tablet for more sensitivity and accuracy when working in constrained areas.

For more than 15 years, [SXblue](#) – Geneq's GPS receiver brand – has been developing and manufacturing professional GPS mapping receivers and software products sold around the world.
