

Geospatial Data Quality Survey

The OGC (MD, USA) Technical Committee's Spatial Data Quality Working Group (WG) has been gathering information and requirements from OGC members for the past year and has now begun primary research on spatial data quality measures. Their survey on spatial data quality went live on Monday 15th October, targeting thousands of geospatial data suppliers and users from around the world.

The group seeks to develop an interoperable framework or model for OGC Quality Assurance Web Services that will enable improved access and sharing of high quality geospatial information. To achieve this goal it is necessary to learn what organisations mean when using the term "spatial data quality". The working group hopes this survey will provide a solid foundation for developing relevant terms of measure and a powerful spatial data quality model.

The survey is available at www.surveymonkey.com/s.aspx?sm=_2ffWZCQbm2ugKS_2fW8A0MWIQ_3d_3d. Results will remain anonymous, and personal information will not be shared with any third party.
