

# GIS 2go Accesses ArcGIS Maps Offline From Tablets

The service GIS 2go by Disy Informationssysteme, Germany, transfers maps from ArcGIS Desktop to tablets (Android or iPad), providing users with access to all GIS and media data wherever they are, even when offline.

The [GIS 2go](#) add-in for ArcGIS Desktop supports data selection, map export and re-import via the cloud. With the app "Cadenza Mobile GIS 2go" installed on a tablet, users have immediate access to their maps, including all attribute data and media – even if they are offline in the field. Graphic notes and media created on the go can also be imported back into ArcGIS Desktop.

Users can interactively navigate on the map while on the go. It is possible to show attribute data and use the graphic notebook to add points, lines and areas or track them via GPS. This information can be complemented with photos and audio/video recordings or text notes. Data captured on the go can easily be imported into ArcGIS Desktop and stored to the local database or file system.

Saving and using mobile maps on a tablet is described in four steps. A personal demo account is offered for interested users in order to test GIS 2go on their mobile device.
