

Integrated Solution for Stereo and Mobile Mapping

Orbit GeoSpatial Technologies showcases an integrated mapping solution for combining stereo and mobile mapping imagery. The photogrammetric solution Strabo and its leading solution for mobile mapping asset inventory has been combined in a single client/server production environment. This integrated and innovating solution is showcased at Intergeo 2011 in Nuremberg, Germany.

VP Business Development and Senior Product Manager at Orbit GT, Peter Bonne, said that stereo-viewing has long been the privilege of the few, and mobile mapping brings as disruptive technology new ways of gathering relevant map data. This integration innovates the way offices can operate whilst using both capitation techniques for what they are best fit.

Orbit GT is on Booth 7.A52.
