

Intergraph G/Technology Selected by The Gas Company in Hawaii

Intergraph (AL, USA) has announced The Gas Company, Hawaii (USA), has selected Intergraph's G/Technology to manage its geofacilities data network, including full gas infrastructure data integration at all levels of systems, applications and views.

G/Technology's gas-specific solutionware will seamlessly manage The Gas Company's planning, design, construction, operation and maintenance functions, simplifying projects and processes.

The contract includes migrating existing gas network data from the company's legacy proprietary commercial GIS into a G/Technology-based geofacilities management system. G/Technology's Commercial-Off-The-Shelf (COTS) architecture mitigates implementation risk, while its open architecture will facilitate enterprise data access by facility designers, Web users and employees involved in compliance, cathodic protection and marketing, providing them with the enterprise information they need to better perform tasks and increase customer service levels.
