

Long-Distance Water Supplier Chooses Intergraph

Zweckverband Wasserversorgung Nordostwürttemberg (NOW), a long-distance water supplier in Germany, has chosen Intergraph to fully replace its existing geographic information system (GIS) and improve the efficiency of its water distribution operations. NOW is the third long-distance water supplier in the Baden-Württemberg area of Germany to choose Intergraph for its infrastructure management needs.

The Intergraph solution will be used to document NOW's complete long-distance water supply network, along with all of its technical assets. The solution will provide consistent support for the company's planning, construction and operational processes, as well as for infrastructure service and maintenance.

Intergraph infrastructure management technology is open and can seamlessly import, process and export data from external systems such as computer-aided design (CAD) applications, allowing NOW to take full advantage of its enterprise data. Users will also be able to access all of the asset data via a simple Web browser from any workstation in the company for maximum speed and efficiency.
