

Luciad Launches Trial of Data Visualisation App

[Luciad](#), specialised in the provision of geospatial situational awareness technology, has launched a free trial of its [Lucy Test Drive](#) application. Based on Luciad's desktop solution LuciadLightspeed, Lucy Test Drive provides users with an interactive interface to visualise geospatial data, and a sample track analysis application for analysing GPX tracks.

The track analysis tool gives users a taste of what sort of applications they can build, and Lucy lets them visualise a number of data formats they support in a 3D map-centric interface. Industries worldwide are generating a growing amount of geospatial data, and this tool helps users to visualise that data and consider how visual analytics and geospatial visualisation can be valuable tools.
