

Map Application Building Software Released

map.apps, the solution from con terra, Germany, for building innovative apps for web and mobile, is now available for software developers via the free Developer Edition. With map.apps, con terra offers the chance to create map applications based on the Esri JavaScript API.

To allow customers, integrators and software developers to simplify creating their own map.apps-based applications, solutions or products, con terra has created a new Developer Edition licensing specifically for the purpose of software development. The Developer Edition is intended only for development of applications based on map.apps. Operational sites then require a standard license by the respective site operators.

Under license of the Developer Edition, a software developer can write any number of applications and solutions. Complying with a "Named User " principle, the license is registered to a specific software developer as an annual subscription and is free of charge.
