

# MapDotNet Support for SQL Server 2008

ISC (FL, USA) fully supports the spatial enhancements of Microsoft SQL Server 2008 in the 6.5 release of MapDotNet Server, their .NET GIS platform.

MapDotNet Server is the .NET-based GIS platform that provides support for spatial data visualisation and analysis. MapDotNet Server also provides Microsoft Virtual Earth compatibility, and offers a starter application template for creating Virtual Earth applications out of the box. With MapDotNet Server and the accompanying SDK, organisations can create interactive maps that provide geospatial visualisation and analysis capabilities.

MapDotNet Server 6.5 is currently undergoing beta testing and will be released in November 2007. In addition to support for SQL Server 2008, it will provide support for the new features in Microsoft Virtual Earth 6.0, and will include upgraded map rendering capabilities, support for Windows Communication Foundation, profiling, event logging, and improved diagnostics.
