Mobile Mapping Feature Extraction Portfolio v11.1

Orbit GT is releasing an upgrade to its Feature Extraction portfolio. It includes an improvement of the viewing engine and measuring features, such as auto-rectification of a snapshot image. The Orbit Mobile Mapping Feature Extraction portfolio contains a series of products aimed at exploiting raw Mobile mapping content as actionable data.

From low threshold Feature Extraction, to workflow-assisted Asset Inventory, this portfolio is available both in stand-alone and in a client-server setup. In combination with Orbit's Content manager, the huge datasets of mobile mapping can now be accessed instantly and without any delay.
