

Near-Real Time Access at GEOINT 2009

The Carbon Project is to bring its near-real time geospatial access solutions to the GEOINT 2009 symposium held this week in San Antonio, Texas. The Gaia SDI platform will be used to access high-value, time-dominant geospatial-intelligence (GEOINT) at the symposium.

Based on Open Geospatial Consortium (OGC) standards and Service Oriented Architecture (SOA), the Gaia SDI platform is designed to provide the next-generation of access, update and geosynchronisation capability for intelligence, military and humanitarian assistance requirements.
