

New High-Res Challenge Searching for Urban Solutions

European Space Imaging's High-Res Urban Challenge gives developers a preview of and access to a valuable imagery dataset. This is the fourth time European Space Imaging is offering the challenge as part of the Copernicus Masters, a competition which seeks ideas and applications for Earth Observation imagery. For anyone who has toyed with the idea of integrating satellite imagery in their solution, this is the 'go-to' competition.

European Space Imaging (EUSI) is giving candidates access to 40cm very-high-resolution satellite imagery with 8 spectral bands over European urban areas - the best available on the market. If you have a solution that could benefit from VHR data then this competition may be for you. Entries close on 13 July.
