

OGC Filter to CarbonTools PRO

The Carbon Project (VA, USA) has announced full support for the Open Geospatial Consortium, Inc. (OGC) Filter Encoding Specification (FE) in CarbonTools PRO.

The addition will allow Microsoft Windows-based systems to access an array of Spatial Data Infrastructure (SDI) content for real-time updates, decision support, analysis and other mission critical applications.

CarbonTools PRO extends the Microsoft .NET Framework for advanced location content handling, mapping and sharing. With CarbonTools PRO you can develop geosocial networking applications or extend existing systems for enhanced geospatial interoperability.

OGC FE support will be integrated into the next CarbonTools PRO release, scheduled for June 2007. CarbonTools PRO is available for US\$1,995 under a per developer license that has no limits, royalties, restrictions or fees on deploying applications - ever.
