

OGC Seeks Public Comment on InfraGML Encoding Standards

The membership of the Open Geospatial Consortium (OGC) is asking for public comment on its candidate InfraGML standards. These define the implementation-dependent, GML encoding of concepts supporting land and civil engineering infrastructure facilities.

InfraGML is a GML implementation of the OGC Land and Infrastructure Conceptual Model Standard ([LandInfra](#)). Developers can use InfraGML to implement software and services that enable users of diverse technologies and vendor platforms to efficiently exchange information about land and civil engineering infrastructure facilities.

In order to achieve consensus on the concepts supporting land and civil engineering infrastructure facilities, a UML Conceptual Model, LandInfra, was developed by the OGC in cooperation with buildingSMART International (bSI) and approved as an OGC standard in August 2016. This model provides a unifying basis for encodings including InfraGML and similar work in bSI.

Due to the breadth of concepts and elements in the LandInfra Model, the subject areas are divided into separate Parts. Similarly, this InfraGML encoding is divided into Requirements Classes which are then grouped into Parts. This separation of InfraGML into Parts was done to streamline the management and creation of each Part, giving each subject its own standards life cycle. Further, it should be easier for software developers to only deal with Parts relevant to their application.

The Parts of InfraGML are as follows:

- Part 0: LandInfra Core Encoding Standard
- Part 1: LandInfra Land Features Encoding Standard
- Part 2: LandInfra Facilities and Projects Encoding Standard
- Part 3: LandInfra Alignments Encoding Standard
- Part 4: LandInfra Roads Encoding Standard
- Part 5: LandInfra Railways Encoding Standard
- Part 6: LandInfra Survey Encoding Standard

The Candidate OGC Land and Infrastructure Conceptual Model Standard is available for review and comment [here](#). Comments are due by 3 March 2017 and should be submitted to requests@lists.opengeospatial.org.

About the OGC

The OGC is an international consortium of more than 525 companies, government agencies, research organisations, and universities participating in a consensus process to develop publicly available geospatial standards. OGC standards support interoperable solutions that "geo-enable" the Web, wireless and location based services, and mainstream IT. OGC standards empower technology developers to make geospatial information and services accessible and useful with any application that needs to be geospatially enabled. Visit the OGC website at www.opengeospatial.org.
