

ONTRACK Implements ESRI GIS

Eagle Technology Group, ESRI's distributor in New Zealand, has won the contract to implement a Web-based GIS visualisation solution using ESRI's ArcIMS Server for ONTRACK, the New Zealand government agency responsible for ownership and management of the national rail network.

The GIS will enable trains to be tracked by satellite and the information fed back to ONTRACK's train controllers. This will provide the controllers with a geographic view of their network. Additionally, it will afford them a much greater degree of positional accuracy and enable them to make better decisions in routing, emergency response, tracking, and other related applications.
