

Orbit Announces FlashMap Web Mapping

ORBIT Geospatial Technologies (Belgium) has announced the release of Orbit FlashMap, a brand new revolutionary web mapping product.

Orbit FlashMap blends into the Orbit product range, connecting to the standard server system, and updated by the Orbit GIS desktop GIS tool. Any data editing is viewed online using the same server technology. The wide range of open API's and format support makes it integratable in any environment.

Orbit FlashMap is designed for webmasters, while presenting the proper tools for the GIS specialist. It is adapted to the internet world where communication is more important than technology, but respects interprofessional technology standards. By choosing Macromedia Flash as user interface, Orbit FlashMap provides a rich user interface experience previously unseen in the geospatial world.
