ParcelStream for Web-Based Mapping Applications

Digital Map Products (CA, USA) has launched ParcelStream, a product that lets web developers use current and accurate property lines for display in any web-based digital mapping application.

Fidelity National Real Estate Solutions already uses ParcelStream to show property line information on its new fast growing CyberHomes site (www.cyberhomes.com), which provides consumers and real estate professionals with valuation data on residential properties. On the CyberHomes website, accurate property lines provided by ParcelStream are integral to the visual representation of property valuation.

Digital Map maintains an easily accessible repository of property lines for 60 million properties in major metropolitan areas. Expansion plans for 2007 include most of the remaining populated areas of the United States.
