# Public Safety Interoperability Framework

Intergraph facilitates multi-agency and multi-jurisdictional data sharing with its Interoperability Framework, an interoperability platform which supports industry standard information exchanges, such as the National Information Exchange Model (NIEM). The Interoperability Framework, based on Microsoft\'s integration and connectivity server platform, Microsoft BizTalk Server, is featured in Intergraph\'s latest-generation computer-aided dispatch (CAD) offering, Intergraph I/CAD version 9.0.

The Interoperability Framework enables public safety agencies to transfer CAD information, allowing for multi-point exchange of information across software applications.

Intergraph's Interoperability Framework was selected as one of the top 15 leading new products of the year introduced at the Association of Public Safety Communications Officials (APCO) International annual conference in Las Vegas in August. The 2009 Hot Products were chosen by representatives from APCO's Editorial Advisory Committee and staff after reviewing more than 40 nominations.
