

Pythagoras at Intergeo 2010

Pythagoras is a CAD software, developed for surveyors, contractors and governments. It's one of the most powerful and intuitive applications released these last years in this segment. Different draw and design functions are brought together in one complete standalone package. The user friendliness makes you, in no time, familiar with the software.

Our programmers are constantly improving and extending the possibilities. Updates, new versions and new features are presented to make our product complete. An example hereof is the new Pythagoras 12.

If you wish to receive more information on Pythagoras, do not hesitate to contact us, or visit us at Intergeo 2010 in Köln (Booth 2B.115).
