

RIEGL USA Relocates to New Facility in Florida

RIEGL USA has announced its relocation to a new state-of-the-art, RIEGL Group-financed North American headquarters and training centre in Winter Garden, Florida. This investment was made possible by the continued success and growth of RIEGL in North America and by the strong confidence that the Austria-based Lidar specialist is placing in the North American market.

RIEGL USA's new facility is located in Winter Garden, a charming city just west of Orlando, Florida. It is designed with future growth in mind. This multi-million-dollar headquarters and training facility features modern training rooms and service areas including climate chambers and laser test ranges for equipment testing and calibration, a customer support centre, a distribution hub, and sales and administration offices. All that comes along with generous break and staff areas including a gym, generous collaboration areas and outdoor work and relaxation space.

[RIEGL USA](#) president, Johannes Riegl, Jr., said: "Over the last couple of years, we have continuously grown our business here in North America and this new facility resembles that continued growth. The support of our headquarters in Austria has been critical to the development of this amazing building we are now in."

Customers and integrators will be able to stop by at the new facility using a helicopter landing pad which will become operational in early 2021.

"Due to current COVID-19 travel restrictions, the official Grand Opening and Ribbon Cutting Ceremony will be delayed and take place in 2021 after restrictions are lifted. It will include an extravagant array of entertainment and food and drinks for our special VIP guests from North America and around the world. Expect to be amazed at our Grand Opening!", stated the company, which is internationally recognized for its advanced Lidar 3D scanning equipment and data processing software.

The new facility has been constructed by a nationally renowned DPR construction company. DPR Construction has utilized RIEGL Lidar terrestrial scanners and UAV-based technologies throughout the construction process to document and monitor the progress of the construction.
