

Safe Software Announces Release of FME 2006

Safe Software Inc. (Canada) has announced the release of FME 2006. FME 2006 refines FME's Workbench authoring environment and continues Safe's initiative to deliver the complete Spatial ETL solution encompassing both raster and vector support. FME 2006 incorporates over 1,000 evolutionary product enhancements requested by FME users. On the raster front, six new raster preview formats have been added and many others have been updated, including enhanced support for Oracle GeoRaster which allows raster data to be loaded into an Oracle Database10gR2.

Newly-added support for the Google Earth KML format enables FME 2006 users to publish spatial data residing in any of over 150 different formats and visualise this information in Google Earth. Also supported for the first time in FME 2006 is GML 3.1.1. This format was approved last May by the Open Geospatial Consortium as the standard XML-based group of formats for representing geographic features.
