

Sanborn Reseller for Virtual Geomatic's LiDAR Software

Virtual Geomatics (TX, SA), a provider of LiDAR solutions has signed a reseller agreement with Sanborn, a leader in the geospatial industry, to serve as a reseller to its customers of the VG4D Suite consisting of Production Manager, Data Manager and Viewer.

The Virtual Geomatics' software solutions are deployed for production in Sanborn's Colorado Springs operations. As its customers move forward with larger mapping programs that require increased resolution and faster delivery schedules, Sanborn has developed proprietary technology to respond to customer demands. By offering the advantages of the VG4D software solutions to its customers, Sanborn will offer even greater value to its customers with the strength of enhanced product quality management and data exploitation capabilities.

The VG4D suite of LiDAR solutions consist of multiple software products, two of which are Production Manager and Data Manager. VG4D Production Manager provides an end-to-end LiDAR production workflow solution including advanced filtering and editing tools, process-oriented workflow management and production metrics. VG4D Data Manager is a subset (does not include the filtering tools) of VG4D Production Manager which has two deployable paths; 1 for the production workflow for QC/edit operations that do not require the filtering tools and 1 for the end-user to have immediate functionality to not only visualize but also to exploit processed LiDAR data.
