

SimActive Launches New One-click Solution for UAVs

SimActive, a Canadian developer of photogrammetry software, has unveiled a new one-click solution for UAV imagery. Correlator3D version 5.2 allows the automatic processing of an entire project in just one easy step. The full workflow, which includes generation of a DSM, DTM and orthomosaic, can be performed in a matter of minutes.

The one-click solution completely eliminates the need for training and allows users with no photogrammetry background to produce accurate results. In parallel, the standard Correlator3D workflow continues to provide more advanced users with additional control and manual editing tools. The new version thus combines, in the same software package, the advantages of a one-click solution as well as of a traditional photogrammetry tool.

According to Louis Simard, CTO of SimActive, his company is the first company to support, within the same photogrammetry product, neophytes as well as advanced users. Clients new to the field can not only acquire an easy solution, but also one that will address their growing needs as their experience and requirements increase, he added.

For a live demonstration at AUVSI's Unmanned Systems 2014 (13-15 May, Orlando, Florida, USA), please visit booth 2569 or send an email to sales@simactive.com.
