# Spatial Wave Releases Mapplet.NET 4.0

Spatial Wave, Inc (CA, USA) has released Mapplet.NET 4.0, which is now shipping to new customers and those on maintenance.

Mapplet.NET is a GIS viewer which takes advantage of technology from ESRI and Microsoft to offer a framework for developing in-house GIS portals. Mapplet.NET 4.0 is built on ESRI's Application Development Framework (ADF) technology and supports both ArcGIS Server and ArcIMS.

Using Mapplet.NET, any organisation can build GIS portals to view and analyse data within hours without the need for any programming. Mapplet.NET has many components which make it an ideal platform for Utility companies interested in developing GIS portals that allow them to view and query not only GIS data but other related facilities databases such as Customer Maintenance or Document Management Systems.  This release builds on the success of Mapplet.NET 3.1's ease-of-use and functionality and includes support and integration of both Google Maps and Microsoft Virtual Earth technology in the viewer.

Spatial Wave is a GIS software company specialising in the development of enterprise specific work flow application solutions. Their solutions enable office and mobile workers in large organisations to enhance their efficiency by taking advantage of GIS technology in their daily work. The solutions are designed to empower their customers to accomplish their work by utilising advanced technology with minimal training.
