

Submit Your Drone Mapping Story!

Drones – professionally referred to as unmanned aerial vehicles (UAVs) or unmanned aerial systems (UASs) – have been a key topic of *GIM International* over the last years. Equipped with an ever-growing choice of sensors, UAVs have evolved into a standard tool for geospatial professionals, and in the upcoming months we will strengthen our focus on the latest drone-related developments in all manner of geospatial applications, ranging from agriculture and vegetation mapping to mining, construction, urban planning and surveying in general. We are always on the lookout for real-life examples of UAV usage in challenging projects for inclusion in our articles. Are you interested in sharing your case study with our readers around the world? Don't hesitate to contact our content manager, Wim van Wegen.
