

Supergeo Launches New Version of SuperGIS Server 3.2

Supergeo has released the newest version of SuperGIS Server 3.2 to help enterprises share diverse geospatial data effortlessly. The latest SuperGIS Server 3.2 is optimised for developers, administrators and front-side users. The built-in SuperGIS Server Manager now provides a new interface to manage all the built applications.

Administrators can better manage SuperGIS Server on the fly. Also, the new interface of SuperGIS Server Manager enables users to overlay maps with online maps like OpenStreetMap and Bing Maps with ease, making GIS data sharing and website establishing much easier and faster.

Developers

New APIs and samples have been added on Supergeo Developer Network (SGDN), to help developers be equipped with better gears to make high-quality and customised maps. The latest API references and Help can be found in the installation package of SuperGIS Server. With this version, all web applications have an optimal Table of Content, allowing users to control the layers more intuitively. What is more, Ultra website supports a new print tool, so that users can easily print the map whenever they find something worthy to be noted.
