# SuperMap iClient 6R for Ajax

SuperMap has released its SuperMap iClient 6R for Ajax (English version). This is a set of Web GIS development kits employing the Ajax technology and the Microsoft Ajax framework. As a cross-browser and cross-platform client development platform product, SuperMap iClient 6R for Ajax can present maps on the client and use third-party maps and services easily to build map application with rich contents and quick response.

As a newly released product, SuperMap iClient 6R for Ajax is characterised by a match with SuperMap iServer Java 6R; service aggregation; independent distribution; simple development and functional extensibility.

SuperMap iClient 6R for Ajax is a professional client GIS programming development tool. It supports common use for map view, data query and enterprise use for building advanced GIS client programs and customising professional GIS services. SuperMap iClient 6R for Ajax, encapsulated by a series of controls and components, performs interaction with Web service layer through a special client proxy, and finally achieves functions on the client side.
