System Migration for Planning Commission

The Transportation Division of the Lancaster County Planning Commission (USA) is to perform a system migration of its legacy GIS-T application from ArcView 3.x to ArcGIS 9.3. The GIS-T legacy application, developed by GeographIT who also takes on the migration, automatically loads and classifies predefined roadway, traffic, bridge, and accident data as event themes mapped to PennDOT's linear referencing system.

The application also provides a Query Builder wizard that enables the user to define, modify, and delete custom queries of event tables. The new application will be developed with .NET 3.5 and ArcGIS 9.3.1 and will integrate PennDOT event data with Lancaster County's state routes, built from their local road centerlines using PennDOT network IDs and measures.
