

# TerraColor Australia and New Zealand Landsat 8 Mosaics Released

Earthstar Geographics, based in San Diego, CA, USA, has announced the release of its new TerraColor NextGen 15-metre-resolution Landsat 8 satellite image mosaics covering Australia and New Zealand. The products are seamless mosaics of pan-sharpened true-colour Landsat 8 satellite images from the 2014-2016 time frame that have been carefully processed to provide high-quality colour and contrast with less than 1% cloud cover.

Eric Augenstein of Earthstar Geographics commented that they are pleased to add these important regions to their TerraColor NextGen product line for clients needing up-to-date medium-resolution satellite image base maps. The Great Barrier Reef is an integral part of the character of the Australian continent, and it has to be represented nearly cloud-free in

its entirety, he added.

[TerraColor](#) NextGen products provide consistent, regional satellite views in true colour for a wide variety of mapping applications, and make a perfect complement to high-resolution imagery. All NextGen products include an ocean mask with blue ocean fill to provide a clean, ready-to-use base map. The imagery can be purchased by tiles, individual countries or large regional areas, and is suitable for mapping at scales of 1:60,000 and higher.
