

The Builder by Leica Geosystems

Leica Geosystems (Switzerland) has announced the Leica Builder, designed to meet the needs of building experts. The three models “Builder T, Builder R and Builder RM” are based on the same software and have the same concept of user interface. This makes switching from one model to the next extremely easy.

Thanks to its unique features, such as the laser plummet, endless drive and the large display, The Builder T theodolite features a laser plummet, endless drive and a large display. The Builder R enables measurements of up to 250m with its electronic laser distance measuring system, thanks to the combination of focussed visible red laser and flat prism. Together with an angle measurement, every point can be determined in reference to a line as well as in height with a single measurement“ without having to reconfigure the Builder.

The Builder RM can contain a digital construction plan: on the construction site construction data can be called up, measurements saved and the information can be directly transferred to a PC for editing. This eliminates mistakes in reading and writing.

The Leica Builder is the newest member of the Leica Geosystems construction family.
