

Topcon GIS Software Offers Cloud-based Data Sharing

Topcon Positioning Group has announced the release of the MAGNET Field GIS software kit designed for efficient data collection, navigation and maintenance tasks. The solution is a field data collection software with useful data sharing capabilities.

Utilising the cloud, MAGNET Field GIS can send and receive data via a company's MAGNET Enterprise account, allowing professionals in the field greater productivity and less time wasted driving to and from an office to deliver collected data.

MAGNET Field GIS is built to easily recognise and adapt to a user's surroundings. It provides a modern data collection solution both in an urban area within a GNSS network and in a rural setting with a DGPS connection. The software package also includes features such as Microsoft Bing Maps for real-time background imaging, popular GIS file-format compatibility and a customisable interface.
