

Upgrade to Geomatica Software

PCI Geomatics has upgraded its Geomatica remote sensing and image processing software. Version 10.3.2 is the latest release available, including additional satellite sensor support in addition to enhanced functionality.

Satellites supported in this release include HJ-1A/B, the first two sensors of the Chinese Environment and Disaster Monitoring Microsatellite Constellation. Upgrades to the math modeling have also improved the overall accuracy of Radarsat-2 correction using the Toutin model with no GCPs; an accurate, alternative solution to the RPC model.

Additionally, Geomatica 10.3.2 includes upgrades to PCI Geomatics' existing ATCOR, atmospheric correction capabilities.

Both Windows and Linux editions of Geomatica 10.3.2 are available.
